"Formerly known as the International Citation Manual"--p. xv.

Have you ever considered how much effect information technology has on society throughout the world? Progress often places lower income and marginalized communities at a distinct disadvantage. Community Participation and Geographic Information Systems, however, offers a detailed look at numerous incidences around the world where communities have ac

Why does the world need anthropology and anthropologists? This collection of essays written by prominent academic, practising and applied anthropologists aims to answer this provocative question. In an accessible and appealing style, each author in this volume inquires about the social value and practical application of the discipline of anthropology. Contributors note that the problems the world faces at a global scale are both new and old, unique and universal, and that solving them requires the use of long-proven tools as well as innovative approaches. They highlight that using anthropology in relevant ways outside academia contributes to the development of a new paradigm in anthropology, one where the ability to collaborate across disciplinary and professional boundaries becomes both central and legitimate. Contributors provide specific suggestions to anthropologists and the public at large on practical ways to use anthropology to change the world for the better. This one-of-a-kind volume will be of interest to fledgling and established anthropologists, social scientists and the general public.

Biopharmaceuticals are emerging as frontline medicines to combat several life-threatening and chronic diseases. However, such medicines are expensive to develop and produce on a commercial scale, contributing to rising healthcare costs. *Developability of Biotherapeutics: Computational Approaches* describes applications of computational and molecular modeling techniques that improve the overall process of discovery and development by removing empiricism. The concept of developability involves making rational choices at the pre-clinical stages of biopharmaceutical drug development that could positively impact clinical outcomes. The book also addresses a general lack of awareness of the many different contributions that computation can make to biopharmaceutical drug development. This informative and practical reference is a valuable resource for professionals engaged in industrial research and development, scientists working with regulatory agencies, and pharmacy, medicine, and life science students and educators. It focuses primarily on the developability of monoclonal antibody candidates, but the principles described can also be extended to other modalities such as recombinant proteins, fusion proteins, antibody drug conjugates and vaccines. The book is organized into two sections. The first discusses principles and applications of computational approaches toward discovering and developing biopharmaceutical drugs. The second presents best practices in developability assessments of early-stage biopharmaceutical drug candidates. In addition to raising awareness of the promise of computational research, this book also discusses solutions required to improve the success rate of translating biologic drug candidates into products available in the clinic. As such, it is a rich source of information on current principles and practices as well as a starting point for finding innovative applications of
